2

Learning objectives

- Understand the basic features of Java
 - ♦ What are portability and robustness?
- Understand the concepts of bytecode and interpreter
 - ♦ What is the JVM?
- Learn few coding conventions
 - ♦ How shall I name identifiers?

Java Timeline

- 1991:  develops a programming language for cable TV set-top boxes
 - ♦ Simple, OO, platform independent
- 1994: Java-based web browser (HotJava),
 - ♦ The idea of “applet” appears
- 1996: first version of Java (1.0)

See also: <http://oracle.com.edgesuite.net/timeline/java/>

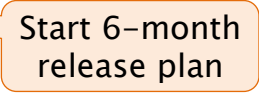

Java timeline (cont' d)

- 1996: Netscape supports Java
 - ♦ Java 1.02 released,
- 1997: Java 1.1 released, major leap over for the language
- 1998: Java 2 platform (v. 1.2) released (libraries)
- 2000: J2SE 1.3 (platform enhancements, HotSpot)

Java timeline (cont' d)

- 2002: J2SE 1.4 (several new APIs), e.g.
 - ♦ XML
 - ♦ Logging
- 2005: J2SE 5.0 (Language enhancements)
 - ♦ Generics
- 2006: Java SE 6 (Faster Graphics),
 - ♦ goes open source
- 2010: Acquisition by **ORACLE®**
- 2011: Java SE 7 (I/O improvements)

Java timeline (cont' d)

- 2014: Java SE 8 (Lang evolution, LTS)
 - ♦ Lambda expressions
 - ♦ Functional paradigm
- 2017: Java 9 released 
 - ♦ Modularization,
 - ♦ `jshell` (REPL)
- 2018: Java 10, Java 11 (LTS)
 - ♦ Local `var` type inference
- 2019: Java 12, Java 13

OO language features

- OO language provides constructs to:
 - ♦ Define classes (types) in a hierarchic way (inheritance)
 - ♦ Create/destroy objects dynamically
 - ♦ Send messages (w/ dynamic binding)
- No procedural constructs (pure OO language)
 - ♦ no functions, class methods only
 - ♦ no global vars, class attributes only

Java features

- Platform independence (portability)
 - ♦ Write once, run everywhere
 - ♦ Translated to intermediate language (bytecode)
 - ♦ Interpreted (with optimizations, i.e. JIT)
- High dynamicity
 - ♦ Run time loading and linking
 - ♦ Dynamic array sizes

Java features (cont' d)

- Robust language, less error prone
 - ♦ Strong type model and no explicit pointers
 - Compile-time checks
 - ♦ Run-time checks
 - No array overflow
 - ♦ Garbage collection
 - No memory leaks
 - ♦ Exceptions as a pervasive mechanism to check errors

Java features (cont' d)

- Shares many syntax elements w/ C++
 - ♦ Learning curve is less steep for C/C++ programmers
- Quasi-pure OO language
 - ♦ Only classes and objects (no functions, pointers, and so on)
 - ♦ Basic types deviates from pure OO...
- Easy to use

Java features (cont' d)

- Supports “*programming in the large*”
 - ♦ JavaDoc
 - ♦ Class libraries (Packages)
- Lots of standard utilities included
 - ♦ Concurrency (thread)
 - ♦ Graphics (GUI) (library)
 - ♦ Network programming (library)
 - socket, RMI
 - applet (client side programming)

Java features – Classes

- There is only one first level concept: the **class**

```
public class First {  
}
```

- The source code of a class sits in a *.java* file having the *same name*
 - ♦ Rule: one file per class
 - ♦ Enforced automatically by IDEs
 - ♦ Case-wise name correspondence

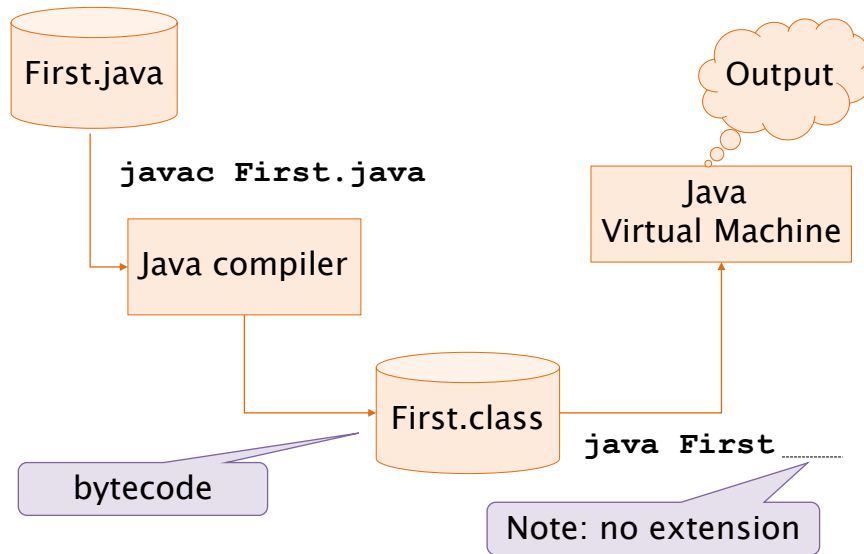

Java features – Methods

- In Java there are no functions, but only methods within classes
- The execution of a Java program starts from a special method:

```
public static void main(String[] args)
```

- Note  In C: `int main(int argc, char* argv[])`
 - ♦ return type is `void`
 - ♦ `args[0]` is the first argument on the command line (after the program name)

Build and run

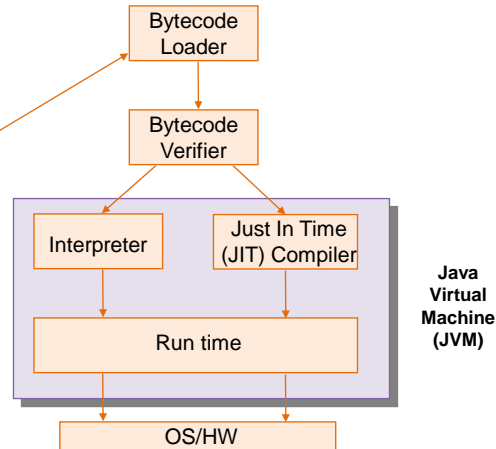

Building and running

Build environment

Run-Time environment

Java Ecosystem

- Java language
- Java platform
 - ♦ JVM
 - ♦ Class libraries (API)
 - ♦ SDK

Dynamic class loading

- JVM loading is based on the **classpath**:
 - ♦ locations whence classes can be loaded
- When class X is required:
 - ♦ For each location in the classpath:
 - Look for file X.class
 - If present load the class
 - Otherwise move to next location

Example: source code

File: First.java:

```
public class First {  
    public static void main(String[] args){  
        int a;  
        a = 3;  
        System.out.println(a);  
    }  
}
```

Example: execution

Name of the class

- Command: **java First**
 - ♦ Take the name of the class (**First**)
 - ♦ Look for the bytecode for that class
 - In the classpath (and '.' eventually)
 - ♦ Load the class's bytecode
 - And perform all due initializations
 - ♦ Look for the **main()** method
 - ♦ Start execution from the **main()** method

Types of Java programs

- **Application**

- ♦ It's a common program, similarly to C executable programs
- ♦ Runs through the Java interpreter (java) of the installed Java Virtual Machine

```
public class HelloWorld {  
    public static void main(String args[]) {  
        System.out.println("Hello world!");  
    }  
}
```

Types of Java programs

Deprecated since Java 9

- **Applet** (client browser)
 - ♦ Java code dynamically downloaded
 - ♦ Execution is limited by "sandbox"
- **Servlet** (web server)
 - ♦ In J2EE (Java 2 Enterprise Edition)
- **Midlet** (mobile devices)
 - ♦ In J2ME (Java 2 Micro Edition)
- **Android App** (Android device)
 - ♦ Java

Java development environment

- Java SE 8 (<http://www.oracle.com/technetwork/java/javase>)
 - ♦ **javac** compiler
 - ♦ **jdb** debugger
 - ♦ **JRE** (Java Run Time Environment)
 - JVM
 - Native packages (awt, swing, system, etc)
- Docs
 - ♦ <http://docs.oracle.com/javase/8/>
- Eclipse: <http://www.eclipse.org/>
 - ♦ Integrated development environment (IDE)
 - ♦ Eclipse IDE for Java Developers
<https://eclipse.org/downloads/packages/eclipse-ide-java-developers/oxygen2>

Coding conventions

- Use **camelBackCapitalization** for compound names, not underscore
- Class name must be **C**apitalized
- Method names, object instance names, attributes, method variables must all start in lowercase
- Constants must be all uppercases (w/ underscore)
- Indent properly

Coding conventions (example)

```
class ClassName {  
  
    final static double PI = 3.14;  
  
    private int attributeName;  
  
        public void methodName {  
            int var;  
            if ( var==0 ) {  
            }  
        }  
    }  
}
```

Deployment – Jar

- Java programs are packaged and deployed in **jar** files.
- Jar files are compressed archives
 - ♦ Like zip files
 - ♦ Contain additional meta-information
- It is possible to directly execute the contents of a jar file from a JVM
 - ♦ JVM can load classes from within a JAR

Jar command

- A jar file can be created using:

```
jar cvf my.jar *.class
```

- The contents can be seen with:

```
jar tf my.jar
```

- To run a class included in a jar:

```
java -cp my.jar First
```

- ♦ The “-cp my.jar” option adds the jar to the JVM classpath

Jar Main class

- When a main class for a jar is defined, it can be executed simply by:

```
java -jar my.jar
```

- To define a main class, a manifest file must be added to the jar with:

```
jar cvfm my.jar manifest.txt
```

Main-Class: First

FAQ

- Which is more “powerfull”: Java or C?
 - ♦ Performance: C is better though non that much better (JIT)
 - ♦ Ease of use: Java
 - ♦ Error containment: Java
- How can I generate an “.exe” file?
 - ♦ You cannot. Use an installed JVM to execute the program
 - ♦ GCJ: <http://gcc.gnu.org/java/>

FAQ

- I downloaded Java on my PC but I cannot compile Java programs:
 - ♦ Check you downloaded Java SDK (including the compiler) not Java RTE or JRE (just the JVM)
 - ♦ Check the path includes *pathToJava/bin*
- Note: Eclipse uses a different compiler than javac

FAQ

- Java cannot find a class (ClassNotFoundException)
 - ♦ The name of the class must not include the extension .class:
 - Es. java First
 - ♦ Check you are in the right place in your file system
 - java looks for classes starting from the current working directory

Wrap-up

- Java is a quasi-pure OO language
- Java is interpreted
- Java is robust (no explicit pointers, static/dynamic checks, garbage collection)
- Java provides many utilities (data types, threads, networking, graphics)
- Java can be used for different types of programs
- Coding conventions are not “just aesthetic”
